

HANDOVER 2 : GROUP K

The project that was handedover to us consisted lots of unnecessary files and code snippets which were not even being used anywhere in the project functionality , due to which initially it became quite difficult and confusing to understand the code and the control flow in the project . We had to spend a lot of time cleaning the code and the files that were not being used in the project implemented by the previous team members .

In addition to that , a search bar and a search button were created in the login page , that too without any event handler associated with it , as we were supposed to create a search product page using the checkboxes too so it was a difficult part to inculcate the search bar along with the checkboxes , but eventually we did it .

Besides these issues there were no other ambiguities or incompleteness during the project handover session . And as a team we tried our best to validate the feature meant to be incorporated in the project along with the suitable alterations in the already implemented feature in the project description document .

In the already existing feature (User login and registration) , we included the forgot password functionality and the proper user authentication , for already existing email id or phone number , and for the missing fields too.

While we included a new page known as the shopping cart page , where users can choose between the required product categories after which the related products from those categories will be shown to them , and , or they can also search the product in the search bar (with the relevant product name) and the product will be shown to them .
