Changes Made In Implementation (Task-3):

1)Changes in login page:

1)Now we have fixed the login user issue as previously it was not working properly .

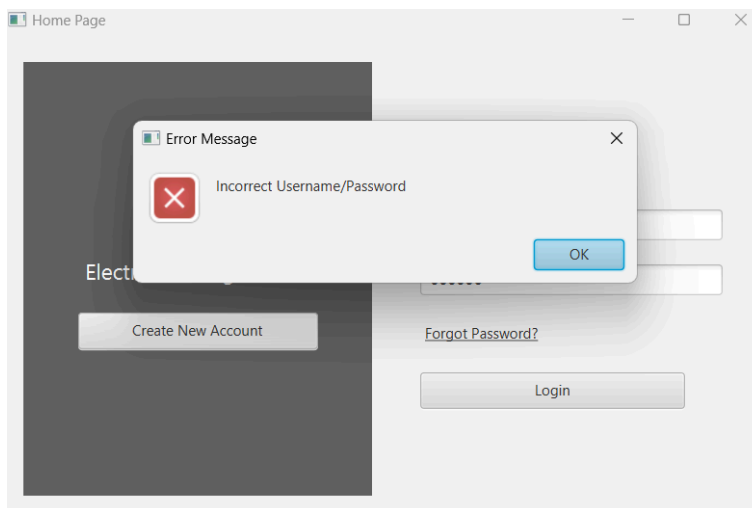

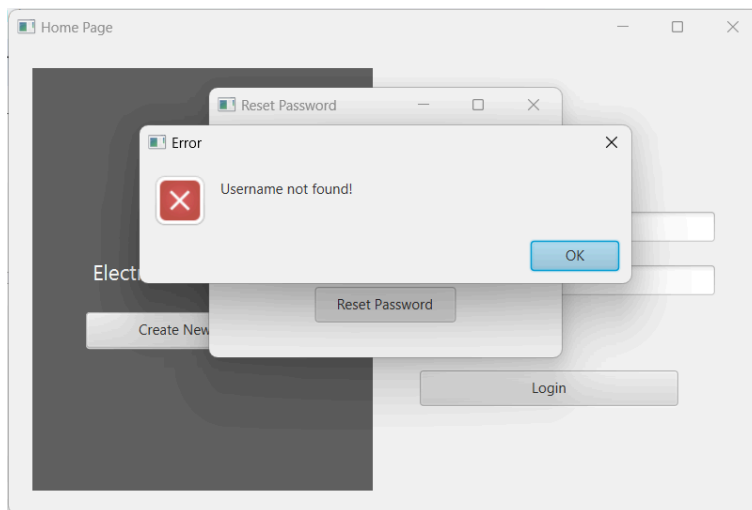

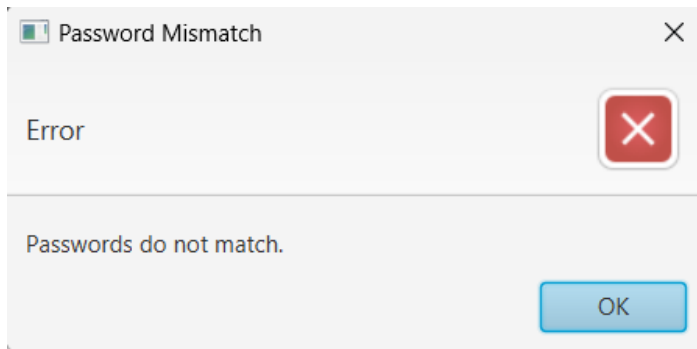

2)An incomplete functionality of “Forgot Password” has been added in the login page.

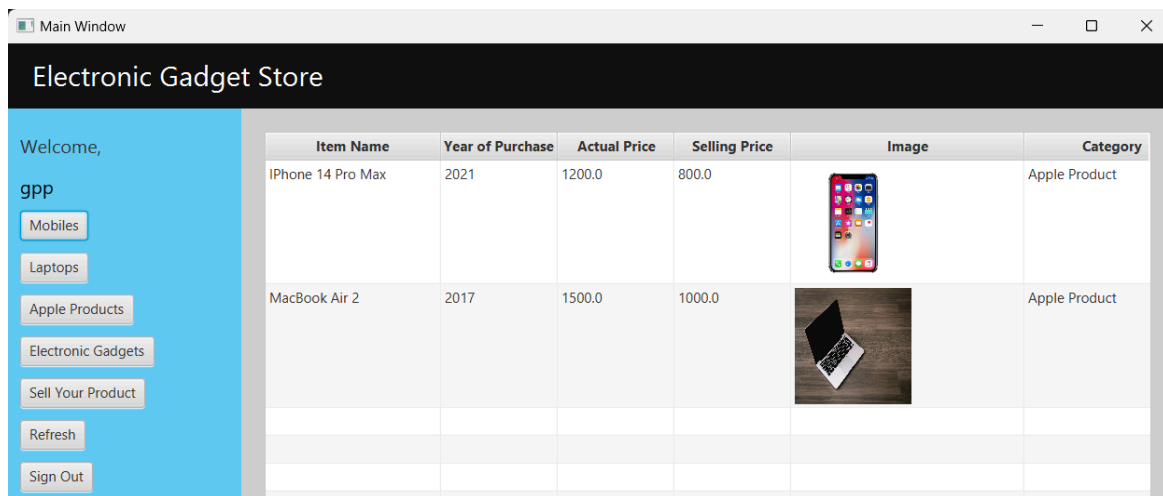

3)The main issue faced by the previous group was to link the database with the GUI has been resolved .

4)Few error alerts has been set in the code if the incorrect information is given to the login page as well as in creating new user page.

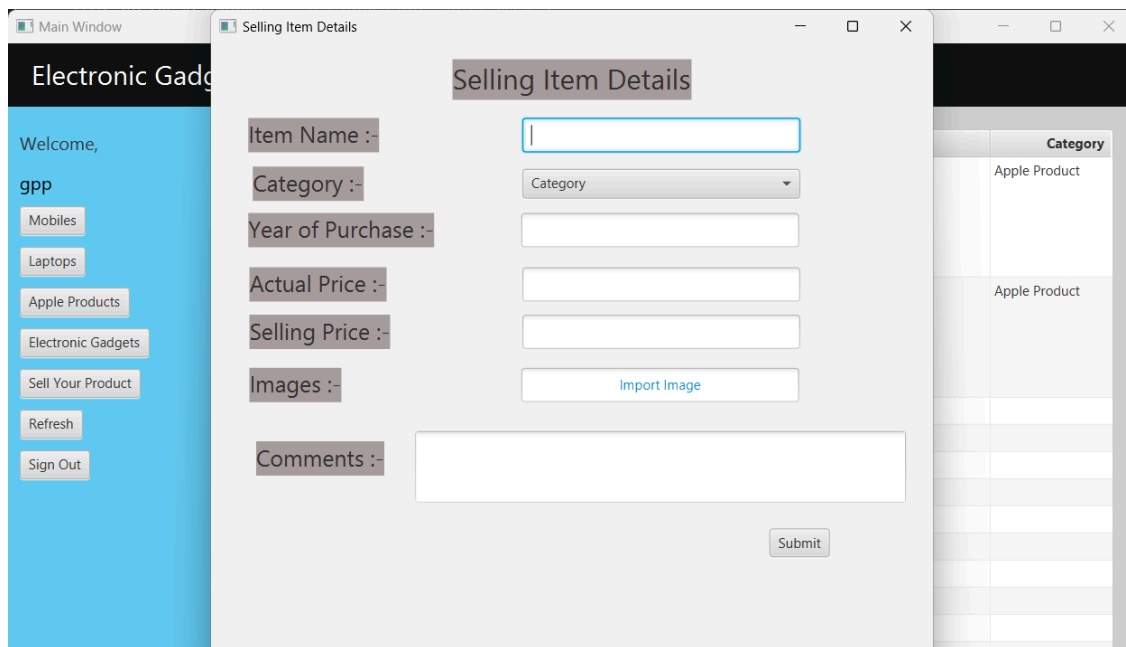

2) Enhancements in previously created products window:

- 1) Made it more pleasing to eye
- 2) Newly added items are now displayed on the product page window table.
- 3) Sorting functionality based on category type (i.e Mobile, Laptop, apple products, etc) has been implemented.
- 4) After inserting a new product from the “sell your product” page and to visualize the new entry one can simply click on the “Refresh button”(new feature).

5) Integration of selling of used products(New Feature):

- 1) New attribute Category has been added in order to categorize the products, to do that we have incorporated category drop down.
- 2) Also, we have provided the hyperlink to import images from users' devices.

Task -3 achievements :

- (1) Refining the Products Page, Selling Page
- (2) Sorting products based on the selection of categories in the product page.
- (3) Connection between database of selling page and product page (user opting to sell their products after adding in selling page can be shown in the products page)
- (4) Enhanced User Interface
- (5) We are able to store the images in the database instead of simply using an image path.

Conclusion:

Overall, the enhancement in existing systems regarding database connection, GUI and alert messages in the form of dialogue box has been fixed and implemented. Moreover, we are able to add new features of selling old products and store them in the database and also display them in GUI from the database.
